Product Vision Document

Project Title: High School Tutoring Course Selection System

SDG: SDG 4 – Quality Education

Project Overview：

Many high school students have problems choosing the right tutoring courses. Sometimes they don't know which subject they need help with, or the course level is too hard or too easy. Because of this, they may waste time and money and still not improve in school.

Our project is to create a High School Tutoring Course Selection System. This system helps students look for tutoring courses and choose the ones that fit their needs. Students can see different subjects, check course information, and decide which class they want to join.

Why this project supports SDG 4：

SDG 4 is about giving everyone access to good education. Many students need extra help outside school, but it is not always easy to find the right tutor.

With this system, students can easily see available tutoring courses and choose based on subject and level. This can help them study better and improve their results. It also makes tutoring information clearer and easier to find.

Target Users：

High School Students
Students who want to improve in certain subjects and find suitable tutoring courses.

Tutors
People who want to teach and provide tutoring for students.

Admin
The person who manages the system and keeps the information updated.

Core Value of the System

The system makes it easier for students to find and choose tutoring courses. Instead of searching in many different places, they can see everything in one platform. Students can check course details and pick what is suitable for them.

This helps students make better choices and improve their learning.
